## <u>ABSTRACT</u>

	2	The instant invention involves the use of a
	3	combination of preparatory steps in conjunction with mass
	4	spectroscopy and time-of-flight detection procedures to
	5	maximize the diversity of biopolymers which are verifiable
	6	within a particular sample. The cohort of biopolymers
	7	verified within such a sample is then viewed with
	8	reference to their ability to evidence at least one
	9	particular disease state; thereby enabling a diagnostician
-piest	10	to gain the ability to characterize either the presence or
The state of the s	11	absence of said at least one disease state relative to
	12	recognition of the presence and/or the absence of said
	13	biopolymer, predict disease risk assessment, and develop
	14	therapeutic avenues against said disease.
